Draft: December 21, 2021

PRIVACY-ENHANCED ONTOLOGIES

TODO: CHOOSE SUBTITLE

DIOGO HENRIQUE SILVESTRE MATOS CEBOLA

Advisers: Matthias Knorr

Auxiliar Professor, NOVA University Lisbon

João Leitão

Auxiliar Professor, NOVA University Lisbon

Henrique Domingos

Associate Professor, NOVA University Lisbon

ABSTRACT

1. What is the problem?
2. Why is this problem interesting/challenging?
3. What is the proposed approach/solution?
4. What results (implications/consequences) from the solution?

Keywords: Keyword 1, Keyword 2, Keyword 3, Keyword 4

RESUMO

1. Qual é o problema?
2. Porque é que é um problema interessante/desafiante?
3. Qual é a proposta de abordagem/solução?
4. Quais são as consequências/resultados da solução proposta?

Palavras-chave: Palavra-chave 1, Palavra-chave 2, Palavra-chave 3, ...

TODO LIST

1) <i>TODO</i> : Explain the motivation for the Semantic Web and use of ontologies.	1
2) <i>TODO</i> : Enumerate industry/investigation examples.	1
3) <i>TODO</i> : Mention cloud and external computing, general adoption growth...	1
4) <i>TODO</i> : Add sources of the examples.	2
5) <i>TODO</i> : Explain tools and workflow used in ontology engineering.	2
6) <i>TODO</i> : Contrast the usefulness with the limitation/security problems of cloud/remote computing	2
7) <i>TODO</i> : Explain why some ontologies need privacy mechanisms. Define the mechanisms needed.	2
8) <i>TODO</i> : Remote Computing. Add more subsections.	3
9) <i>TODO</i> : Data Security. Add more subsections.	3
10) <i>TODO</i> : Operation Security. Add more subsections.	3

INTRODUCTION

1.1 Context

1. Briefly contextualize the Semantic Web. Why are ontologies relevant? **T**¹
2. State of adoption. How/where are ontologies being used? **T**²
3. Future expectations. How will the technology evolve? **T**³

1) *TODO*: Explain the motivation for the Semantic Web and use of ontologies.

2) *TODO*: Enumerate industry/investigation examples.

3) *TODO*: Mention cloud and external computing, general adoption growth...

In 2001, the term *Semantic Web*[1] was first used to define what would be the evolution of the *World Wide Web*. The *World Wide Web* solved the challenge of distributing information at scale and globally, however it was designed for human use. In the traditional *Web*, documents are easily accessible and readable by humans, but for automated agents little more than document retrieval is possible. Contrary to humans, machines cannot reason over the information they access if they do not know the semantics of the data.

The *Semantic Web* addresses this issue, by redesigning the representation of information, in a way that not only preserves meaning and relationships but is also machine-readable. A concept is mapped to a unique identifier, and meaning is encoded in sets of triples, each triple consisting of a subject, predicate and object (similar to an elementary sentence).¹ To represent relevant concepts, and their relations, in specific domains, *ontologies* are then built, using these specifications.

1) [Diogo]: Very general explanation because details will be covered in the State-of-the-Art chapter.

This novel method of knowledge representation differs from the previous, centralized way, and greatly simplifies the process of interconnecting different *knowledge bases*. With centralized representations both parties need to agree on the semantics of the data, in contrast, using ontologies, information is semantically linked by default. In the *Semantic Web*, *automated agents* can truly communicate, share and reason about distinct *knowledge bases*.

Nowadays, this technology is becoming more widely used with ontologies being developed in a variety of domains ranging from the health sector (e.g. NCI Thesaurus, developed by the National Cancer Institute (NCI) or the Gene Ontology (GO), the world's largest source of information on the functions of genes, funded by the National Human

Genome Research Institute) to linguistics (e.g. WordNet, representing semantic relationship between words in over 200 languages). **T**⁴ With ontologies gradually growing in dimension, the industry is currently evolving towards the use of collaborative solutions and *outsourcing* computations, relying on cloud infrastructures or other shared computing platforms (e.g., Grid5000).

4) *TODO*: Add sources of the examples.

1.2 Problem

5) *TODO*: Explain tools and workflow used in ontology engineering.

6) *TODO*: Contrast the usefulness with the limitation/security problems of cloud/remote computing

7) *TODO*: Explain why some ontologies need privacy mechanisms. Define the mechanisms needed.

1. How is the current state of ontology development/engineering? **T**⁵
2. Why remote computation is gaining adoption in the area, but what are current limitations/problems unresolved? **T**⁶
3. Why is there need for privacy in ontologies? **T**⁷

1.3 Proposed Solution

Briefly explain proposed solution. The scope of the solution, contributions, and how will it solve the problems mentioned in previous section.

1.4 Document Organization

Specify the document organization, per chapter.

STATE OF THE ART

2.1 Semantic Web

I²

2.1.1 RDF

2.1.2 RDF Schema

2.1.3 OWL2

2.1.4 SPARQL

2.1.5 SWRL

2.1.6 Reasoners

2.1.7 RDF Stores

2.1.8 Development tools

2.2 Remote Computing

T⁸

2.2.1 Cloud Infrastructures

2.2.2 Virtualization

2.3 Security

2.3.1 Data Security

T⁹

2.3.2 Operations Security

T¹⁰

2) [Diogo]:
Should I do more
subsections: e.g
Web Resource Rep-
resentation -> RDF
...

8) *TODO*: Remote
Computing. Add
more subsections.

9) *TODO*: Data Se-
curity. Add more
subsections.

10) *TODO*: Opera-
tion Security. Add
more subsections.

WORK PLAN
